

Sensor Flujo

Documento Sin título

[descargar pdf](#)

The MICRO-FLOW Sensor is a flow detecting device, used within a semi or fully automated metering process, to detect whether material has been dispensed.

The MICRO-FLOW Sensor does not control the metering volume. It is used particularly when handling unfilled grease with NLGI class 1 to 3, high viscosity oils or silicone-oils.

The MICRO-FLOW Sensor can be adapted to the DOPAG Micro and Mini metering valve as well as to the 419 range of the metering valves.
